Patent No. 595529

GENERAL INFORMATION:
APPLICANT: Holmes, Todd C.
APPLICANT: Levitan, Irwin B.
APPLICANT: Brandeis University
TITLE OF INVENTION: Mechanism for the Regulation of Ion
TITLE OF INVENTION: Channel Activity
FILE REFERENCE: BRU096-02
CURRENT APPLICATION NUMBER: US/08/769,745
CURRENT FILING DATE: 1996-12-19
NUMBER OF SEQ ID NOS: 41
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   44.3%; Score 27; DB 5; Length 10; 62.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 149, Application US/08471068
Patent No. 5948635
GENERAL INFORMATION:
APPLICANT: ROWIKES, D. M.
TITLE OF INVENTION: Totally Synthetic Affinity Reagents
NUMBER OF SEQUENCES: 186
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                     APPLICANT: Kay, B. K.

CTHER INFORMATION: Phakellistatin 10 is a

CTHER INFORMATION: cell growth inhibitory peptide with

CTHER INFORMATION: activity in murine lymphocytic leukemia

CTHER INFORMATION: cell line of 2.1 mg/ml.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 26, Application US/08483077C
Patent No. 5811391
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Archenius, Thomas S.
APPLICANT: Tempczyk, Anna
APPLICANT: Elices, Mariano J.
APPLICANT: Zhong-Li
TITLE OF INVENTION: Cyclic CS-1 Peptidomimetics,
TITLE OF INVENTION: Compositions and Methods of Using Same

summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

| TITLE OF INVENITON: Membrane Dipeptidase

                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   APPLICANT: Ruoslahti, Erkki
APPLICANT: Ruoslahti, Renata
APPLICANT: Rajotte, Daniel
APPLICANT: Rajotte, Daniel
TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using
TITLE OF INVENTION: Membrane Dipeptidase
TITLE OF INVENTION: Membrane Dipeptidase
TITLE REFERENCE: P-J 3443
CURRENT FILING DATE: 1999-02-26
EARLIER APPLICATION NUMBER: 09/042,107
EARLIER APPLICATION NUMBER: 09/042,107
SAFLIER PILING DATE: 1998-03-13

Ig heavy chain C region - Pacific hagfish (fragment)
C;Species: Eptatretus stouti (Pacific hagfish)
C;Date: 18-Oct-1991 #sequence_revision 18-Oct-1991 #text_change 16-Aug-1996
C;Accession: C39111
R;Varner, J.; Neame, P.; Litman, G.W.
Proc. Natl. Acad. Sci. U.S.A. 88, 1746-1750, 1991
A;Title: A serum heterodimer from hagfish (Eptatretus stoutii) exhibits structural simil: A;Reference number: A39111; MUID:91156684; PMID:2000382
A;Accession: C39111
A;Status: preliminary
A;Molecule type: protein
A;Residues: 1-10 <VAR>
C;Keywords: heterotetramer; immunoglobulin

(LUDW-) LUDWIG INST CANCER RES

WPI; 2001-442248/47.

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, cover and the condition is characterised by anglogenesis, neovascularisation or lymphanglogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, corebrovascular accident, post-angloplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive cerebrovascular accident, post-angloplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive corpusated anglogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic with at least one biological activity induced by VEGF, VEGF or -D and are also used in combination with an anti-inflammatory agent, to treat a channal in the colling are lastivity induced by VEGF, corlon and also when a condition and archititis, psoriasis and also when and also were also used in combination with an anti-inflammatory agent, to treat a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

```
The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CV WGGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betact carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteinne residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior or cyclisation are used to interfere with angiogenesis, conversally according to a sequence of condition or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC forcondition is diabetic retinopathy, psoriasis, arthropathy, chemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restencisis, head, heat or cold crauma, substance-induced neovascularisation of the liver, excessive chormoe-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral linbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere contain inflammation, especially rheumatoid arthritis, psoriasis and and accident processed and accident processed and accident and acc

  The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is madelled on the expose loop of human vEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cycleine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis.

The condition is labelic retinopathy, psoriasis, arthropathy, chemangiona, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive corneams, substance-induced neovascular sequelae, now accountant of peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid a condition as a condition characterised by fluid a condition are limbed by indication of the liver in a mammal the mammal has a condition characterised by fluid accumed by the condition characterised by fluid are mammal the mammal has a condition characterised by fluid are mammal the mammal has a condition characterised by fluid are mammal the mammal has a condition characterised by fluid are mammal the mammal has a condition characterised by fluid are mammal the mammal has a condition of the liver liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CV Wyope (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-composed loop of a growth factor protein and peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior compileriation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC Cocyclisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive corporation induced neovascularisation of the liver excessive corporation. The peptides are also used to modulate vascular permeability corporation in peripheral limbs or in lungs, peritoneal cavity, pleura, corbinant the peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a corporation inflammation, when an anti-inflammatory agent, to treat a corporation inflammation with an anti-inflammatory agent, to treat a corporation inflammation with an anti-inflammatory agent, to treat a corporation inflammation with an anti-inflammatory agent, to treat a corporation in the peptides are used to induced are also used in combination with an anti-inflammatory agent, to treat a corporation inflamented by the corporation in t

growth factor; angiogenesis;

```
Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.

characterised by angiogenesis, in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition is diabetic retinopathy, psoriasis, arthropathy.

The condition is diabetic retinopathy, psoriasis, arthropathy.

The condition is diabetic retinopathy, psoriasis, arthropathy.

Cerebrovascular accident, post-angioplasty restenosis, head, head or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in amammal (the mammal has a condition characterised by fluid or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere wasculature. The monomeric and bicyclic peptides are used to interfere wasculature. The monomeric and bicyclic peptides are used to interfere can be least one biological activity induced by VEGF, VEGF. Or -D and are also used in combination with an anti-inflammatory agent, to treat a chick of the combination with an anti-inflammatory agent, to treat a chick of the combination with an anti-inflammatory and
The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides to yoxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclistation are used to interfere with angiogenesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        or cold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diabetic retinopathy

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 49; Page 32; 102pp; English.

characterised by angiognesis, neovascularisation or lymphanglogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-rangioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to image blood vessels and lymphatic with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in with an anti-inflammatory agent, to treat a characterise in the periods are used to interfere the set also used in a mani-inflammatory agent, to treat a The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition inflammation, especially rheumatoid arthritis, psoriasis diabetic retinopathy

Angiogenesis-associated polypeptides especially the 121, 165 or 189 isoforms of VEGF-A, the 167 isoform of VEGF-B, or VEGF-C or -D; a (co-) receptor of VEGF-A, the 167 isoform of VEGF-B, or VEGF-C or -D; a (co-) receptor of VEGF-A, the 167 isoform of yegren, or vegetor or veceptor of vEGF-A, the 167 isoform of yegren of vEGF-B, or vEGF-C or -D; a (co-) receptor of vEGF-A, the 167 isoform of yegren or veceptor of vEGF-B, or vEGF-C or -D; a (co-) receptor of vEGF-A, the 167 isoform of year of vEGF-B, or vEGF-C or -D; a (co-) receptor of vEGF-A, the 167 isoform of year of vEGF-B, or vEGF-C or -D; a (co-) receptor of vEGF-A, the 167 isoform of year of year of year of the vector in mammals, particularly humans but also farm animals and pets, also many other conditions associated with excessive angiogenesis, specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Active immunization against angiogenic proteins, useful for treating e.g. tumors and inflammation, particularly contains vascular endothelial growth factor or its receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ophthalmological; gynecological; antiarteriosclerotic; virucide; hepatotropic; dermatological; anti-HVV; antidiabetic; antipsoriatic; antirtheritic; antithyroid; immunization; angiogenesis; vascular endothelial growth factor; VEGF; neuropiln; placental growth factor; tumor; neoplasias; metastases; inflammation; autoimmunity; eye disease; arthritis; endometriosis; arteriosclerosis; edema; hepatitis; Kaposi sarcoma; diabetes; psoriasis; rhundacid arthritis; thyroiditis; diabetic retinopathy; transplant rejection; macular degeneration; neovascular glaucoma;
                                                                                                                                                                            Gaps
are also used in combination with an anti-inflammatory agent, to tree chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human VEGF-D-derived peptide #18 for anti-angiogenesis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antiangiogenic; cytostatic; antiinflammatory; immunosuppressive;

malignant or benign neoplasias (and their metastases), acute or chronic inflammation, autoimmunity and eye diseases (claimed). Among the diseases that may be treated are arthritis, endometriosis, arterisclerosis, edema, infectious diseases (hepatitis, endometriosis arcoma), diabetes, psoriasis, rheumatoid arthritis, thyroiditis, diabetic retinopathy, transplant rejection, macular degeneration, neovascular glaucoma, hemangioma and angiofibroma. The method destroys calls that are the source of angiogenic proteins, rather than just neutralizing the activity of such proteins (as in passive immunization). This sequence represents an immunisation peptides of the invention derived from the VEGF proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an active immunization against angiogenic proteins comprising administration of a vaccination composition (A), optionally containing an adjuvant, that comprises polypeptides (I) directly associated with an innorease in angiogenesis, their variants, or their encoding polynucleotides (II). Angiogenesis-associated polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Active immunization against anglogenic proteins, useful for treating e.g. tumors and inflammation, particularly contains vascular endothelial growth factor or its receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antiangiogenic; cytostatic; antiinflammatory; immunosuppressive; ophthalmological; gynecological; antiarteriosclerotic; virucide; hepatorropic; dermatological; anti-HIV; antidabetic; antibsoriatic; antiricthritic; anti-HIV; antidabetic; antioscriatic; antiarthritic; anti-HIV; antidation; angiogenesis; vascular endothelial growth factor; VEGF; neuropilin; placental growth factor; tumor; neoplasias; metastases; inflammation; autoimmunity; eye disease; arthritis; endometriosis; arteriosclerosis; edema; hepatitis; Kaposi arccoma; diabetes; psoriasis; rheumatoid arthritis; thyroiditis; diabetic retinopathy; transplant rejection; macular degeneration; neovascular glaucoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human VEGF-D-derived peptide #20 for anti-angiogenesis treatment.
                                                                                                                                                                                                                                                                                                                         ;

cs are: members of the vascular endothelial growth factor (VEGF) family, especially the 121, 165 or 189 isoforms of VEGF-A, the 167 isoform of VEGF-B, or VEGF-C or -D; a (co-)receptor of VEGF-A, the 167 isoform of VEGF-I, c 2 or -3; NRP-1 or -2 (members of the neuropilin family); or placental cgrowth factor. (A) is used for treatment or prevention of tumors in mammals, particularly humans but also farm animals and pets, also many other conditions associated with excessive angiogenesis, specifically cally cally many neoplasias (and their metastases), acute or chronic inflammation, autoimmunity and eye diseases (claimed). Among the diseases that may be treated are arthritis, endometriosis, arteriosclerosis, dedema, infectious diseases (hepatitis and Kaposi sarrooma), diabetes, psoriasis, rheumatoid arthritis, thyroiditis, diabetic retinopathy, transplant rejection, macular degeneration, neovascular glaucoma, contant and magiofibroma. The method destroys cells that are the memory and angiofibroma. The method destroys cells that are the source of angiogenic proteins, rather than just neutralizing the activity of such proteins (as in passive immunization). This sequence represents

The sequence represents a monomeric monocyclic peptide of the invention,

```
whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclisaing the peptide by oxidiaing the cysteine residues. The monocyclic peptides, dimeric bicyclic peptide (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, cocyclisation or lymphanglogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphanglogenesis in a mammal with a condition characterised and acident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive
                                                                                                                                                                                                                                                                                                                                                                                                                                                       hormone-related angiogenic dysfunction, diabetes induced necessaries because, hypertension induced necessular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal nas a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. Or -D and are also used in combination with an anti-inflammatory agent, to treat a

๙ Identifying proteins or peptide(s) which bind a ligand - by screening

```
AAR58412-42 are overlapping 8-mer peptides of the binding domain of TSAR (Totally Synthetic Affinity Reagents) peptide TSAR (46.9-2 (AAR58411).

These bind (partially) a monoclonal antibody, ie. anti-CEA (46 (anticatronal antigen). TSAR peptides are generated using generic carcinoembryonic antigen). TSAR peptides are generated using generic oligonucleotides (see AAQ70470-73 for examples). TSARs are concatenated heterofunctional proteins or peptides. Comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The TSARs or compsons. comprising a TSAR binding domain can be used in vivo to deliver comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a nucleic acid molecule encoding an ovarian cancer antigen, CA125. Nucleic acid molecules, vaccine and methods are useful for diagnosing, preventing and treating cancer, e.g. pancreatic, lung, ovarian, breast or endometrial carcinoma. The invention is useful

SH2 binding peptides containing these core peptides are used to treat of diagnose diseases associated with aberrant cell growth, differentiation or regulation which is associated with aberrant defects in receptor tyrosine kinase pathways, by partially blocking or inhibiting a cellular signal transduction pathway. The disease may be cancer, a developmental or differentiation disease or insulin-resistant (or non-insulin dependent) diabetes
   in gene therapy and as vaccines. The present sequence is CA125/MUC16 Oglycosylation site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Core peptide; src homology region 2 binding peptide; SH2; cell growth, differentiation; regulation; receptor tyrosine kinase pathway; cancer; signal transduction pathway; non-insulin dependent diabetes; insulin-resistant diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "given in the patent as pI, no further details given. May be intended to be phosphotyrosine"
                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide(s) which bind to SH2 domains - are used to treat diseases associated with aberrant cell growth, differentiation or regulation associated with defects in receptor tyrosine kinase pathways.
                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a core peptide of an src homology region 2 (SH2) binding peptide corresponding to the formula: Z7-X-Z8-X X = any D- or L-amino acid; Z7 = phosphotyrosine or its isoster; Z8 = asparagine or its isostere; the amino terminus is acylated, and the peptide is less than 14 residues in length, with the proviso that if Z7 is phosphotyrosine and Z8 peptides in length, with the proviso that if Z7 is phosphotyrosine and Z8 peptides containing this core peptide are used to treat of diagnose diseases associated with aberrant cell growth, differentiation or regulation which is associated with defects in receptor tyrosine kinase pathways, by partially blocking or inhibiting a cellular signal transduction pathway. The disease may be cancer, a developmental or differentiation disease or insulin-resistant (or non-insulin dependent)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide(s) which bind to SH2 domains - are used to treat diseases associated with aberrant cell growth, differentiation or regulation associated with defects in receptor tyrosine kinase pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

Sequence 10 AA;

```
This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which compyrises an antigionic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a hepatitis C virus CTL epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                            pathogenic virus; alternative reading frame; antigenic determinant; virucide; vaccine; therapeutic agent; infection; epitope peptide; HLA-allele; CTL.
                                                                                                                               Hepatitis C virus CTL epitope peptide #4272.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 14; Page 139; 220pp; English.

US-09-676-475A-63

Sequence 63. Application US/09676475A

Patent No. 6784153

GENERAL INFORMATION:

APPLICANT: Racotalahti, Brkxi

APPLICANT: Racotalahti, Branta

APPLICANT: Racotalahti, Branta

APPLICANT: Rajotte, Daniel

TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using

TITLE OF INVENTION: Membrane Dipeptidase

FILE REFERENCE: P-LA 437.

CURRENT APPLICATION NUMBER: US/09/676,475A

CURRENT FILING DATE: 1998-03-13

PRIOR FILING DATE: 1998-03-13

SOFTWARE: PRECENTIN Ver. 2.0

SEQ ID NOS: 452

SEQ ID NO 63

EINGTH: 9
